

The Tower Blueprint

How a tower that doesn’t exist yet becomes a real photo, in five steps.

A stack of boxes becomes a skyline

Burtville, Dubai: two towers that don’t exist. On top, the block model Claude builds in the browser from a few numbers. Below, the same camera after Higgsfield. Here are the five steps, the same ones we follow for developers.

Step 1

The massing from the numbers

Prompt — Claude

Build a 3D massing model in three.js, in real metres, on a plot 70 × 45 m by the sea. A podium of 4 floors at 4.5 m. On it two residential towers of 42 and 55 floors, 3.4 m floor to floor, each one stepping back 3 m every 12 floors. Draw a thin line at every slab and balconies 2.5 m deep. Put the neighbouring towers around as plain grey boxes at their real heights. Camera on the beach 600 m away, at 1.7 m, 50 mm, vertical lines straight.

The height is the floors times 3.3 to 3.5 m, plus 4.5 to 6 m for each podium floor and 8 to 10 m for the crown. Get these right and the tower looks real before any material goes on.

Step 1

Draw every floor not just the box

The AI copies what it sees. A plain box comes back as a generic glass tower, so the 3D has to show what makes yours different.

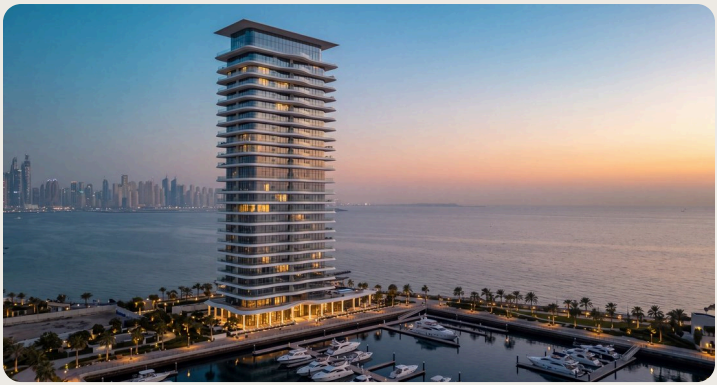

- One line for every slab, so the floors can be counted.
- Balconies, setbacks and terraces at their real depth.
- The podium and the entrance, where people look first.
- The crown: the last floors, the roof terrace, the pool.
- The ground in front: sea, road or park, and the towers next door.

Final image

Step 2

The camera
far and low

- Far away, 300 to 800 m, across the water or from the street.
- 50 to 85 mm. A wide lens up close makes the tower lean back.
- Vertical lines straight, like a shift lens: never tilt up.
- The tower fills two thirds of the height, with sky above the crown.

Step 3

Name it
in three parts

Leave one out and the model fills it with its favourite tower: blue glass, the same balcony on every floor, nothing on top. Name the three parts, each with its material and colour.

1 **Crown**
the last floors, lights, roof terrace

2 **Body**
glass tint, frames, balconies, fins

3 **Podium**
stone, lobby glass, canopy, gardens

Step 3

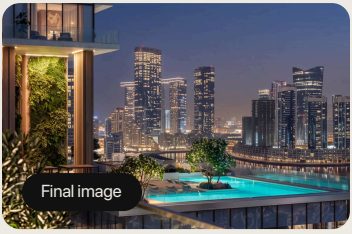

The city around it

On Higgsfield, with Nano Banana Pro, upload the 3D screenshot first, then a real sample of the facade materials. Then say where the tower stands and what time it is.

Prompt — Nano Banana Pro

Image 1 is the 3D: keep the camera, the two towers, the number of floors and every setback exactly as they are. Floor-to-ceiling glass with a warm bronze tint, slim champagne aluminium frames, balconies with clear glass rails, as in image 2. A podium in honed travertine with a double-height glass lobby. Behind, the Dubai Marina skyline, the grey boxes become the real neighbouring towers. Sun low on the right at six in the evening. Editorial architecture photograph, natural colour, fine film grain.

Step 3

Words to drop and what to write

Drop	Write
futuristic skyscraper	the floors, the height and the setbacks
iconic, stunning	the shape: two towers, a step every 12 floors
glass facade	the tint, the frame colour, the balcony depth
Dubai skyline	which district is behind, seen from where
cinematic dusk	where the sun is and what time it is

Never write the name of a real tower you like: the model copies it, logo and all.

Step 4

Count the floors before you send it

- The same number of floors and setbacks as the 3D.
- Vertical lines straight, the tower not leaning back.
- Balconies that line up floor after floor, with no melted slabs.
- Cars and people at the right size next to the podium.
- At night, not every window lit, and no invented logos.

If one check fails, don't edit the picture. Write the whole prompt again with the fix inside and generate from the 3D. Upscale only the image you keep.

Step 5

Then the floors
sell it before it exists

Buyers choose a floor, not a tower. From the plan of each floor, Claude builds the apartment, and the photo shows the view from that height. This is SAMAR, the demo we made for a tower in Dubai Marina.

The full method is on our site

This is the short version. Playbook 03 has the 8 images and the 30-second video for a launch, with what every step costs, and in a lesson we do it together on your tower.
