BUILT WITH CLAUDE, FILMED WITH HIGGSFIELD

HOW TO MAKE A 3D THAT SELLS WITH AI

THE FULL BLUEPRINT

EVERY STEP AND EVERY PROMPT,
WORD FOR WORD

OMNYA LAB

START HERE

WHAT YOU'LL HAVE AT THE END

- ✓ A house built in code in the browser, in real metres, with the furniture at its catalogue sizes.
- ✓ One camera rail through the house, from the garden to the pool, 15 seconds long.
- ✓ Three approved photos of that house, made from the 3D with the camera locked.
- ✓ A 15 second walk-through film on Seedance 2.5 that follows the 3D and looks like the photos.
- ✓ The 3D and the film lined up frame by frame, ready for the split reel that gets the comments.

WHAT YOU NEED

Claude Code
It reads this PDF, writes the 3D in three.js and checks every step with you.

Higgsfield
Nano Banana Pro for the photos and Seedance 2.5 for the film, on the site or through its connector in Claude.

ffmpeg
To trim, grade and resize the film. Claude installs it for you.

Chrome
The 3D runs in the browser, and Claude records the walk from it frame by frame.

CHAPTER 00

THE FAST WAY
CLAUDE CODE

Open Claude Code in an empty folder, drop this PDF in it and paste the prompt below. Claude reads the PDF page by page, asks you about your house and then builds it with you one step at a time, showing you the result before it moves on.

```
I bought the Full Blueprint "How to make a 3D that sells with AI" by Omnya Lab.
The PDF is in this folder: read it page by page, from chapter 01 to chapter 11,
before you do anything.

I want what you see in the Omnya Lab reel (instagram.com/omnyalab): a house
built in code in the browser, three approved photos made from it with the camera
locked, and a 15 second walk-through film on Seedance 2.5 that follows the 3D.

First ask me about my house: plans or measurements, ceiling height, the rooms
the camera should cross, the materials, where it stands and what time of day.
Then follow the PDF in order. After every step show me the result (the 3D in the
browser, the camera rail, each photo, the film) and wait for my OK before the
next one. Use Higgsfield for the photos and the film. If something fails one of
the checks in chapter 10, fix it before you go on.
```

This prompt is the one we wrote for you. Every other prompt in this PDF is the one we actually sent, copied word for word.

CHAPTER 01

THE BRIEF

IN REAL NUMBERS

The villa in the reel started from a few Pinterest references and a few lines from Nico, in chat, while the 3D was being built. These are the ones that changed the result, translated from Italian:

- *“Twelve to fifteen seconds of video at most: on Seedance 2.5, fifteen seconds in 1080p cost 240 credits.”*
- *“From the middle of the foliage you go in, you show the rooms and the pool, then you go back up and show the villa from outside.”*
- *“It’s small, it has to have real sizes, and the pool has to be better. It needs a nice entrance from the side.”*
- *“The furniture is too small, use real measurements. No small vertical windows, huge glass panels.”*
- *“Take the plants out of the way, put them properly in a pot.”*
- *“The ceiling is too low like this.” It went from 3.3 to 4 m.*

Write your brief the same way: the length of the film first, then the route, then the sizes. This is what the final house came to:

ITEM	VALUE
Footprint	30 × 14 m, two floors
Ground floor	raised 1.2 m above the garden
Ceilings	4.0 m on the ground floor, 3.2 m upstairs
Rooms on the route	living room 8.4 × 9.5 m, dining 6 × 9.5 m, kitchen 7 × 9.5 m
Entrance	on the side, double height, pivot door 1.8 × 3.0 m
Pool	16 × 5 m with a 0.5 m coping
Eye height	1.55 m above the floor
Sun	azimuth 160°, elevation 44°, 3 pm

CHAPTER 02

THE HOUSE IN CODE

THREE.JS, IN REAL METRES

Claude writes the house as one JavaScript file that three.js draws in the browser. No SketchUp, no 3ds Max: you describe it in numbers and Claude builds it. The top of our file holds the numbers everything else hangs from:

```
const FL = 1.2;                          // ground floor raised above the
garden
const CEIL = FL + 4.0;                   // 4 m ceilings (at 3.3 m the room
felt squashed)
const R1 = CEIL + 0.15, R1T = R1 + 0.9; // ground floor roof with the gold
fascia
const F2 = R1T, CEIL2 = F2 + 3.2, R2 = CEIL2 + 0.15, R2T = R2 + 0.8;
const X0 = -15, X1 = 15, Z0 = 0, ZS = 9.5, Z1 = 14;   // house 30 x 14 m
const E = FL + 1.55;                     // eye height
```

FURNITURE AT CATALOGUE SIZE

Every piece of furniture is a real model (free CC0 models from Poly Haven and Khronos) scaled to the size of the piece it stands for: the sofa 3.6 m, the coffee table 1.5 × 0.85 m, the dining table 3.6 × 1.0 m, the island 6.0 × 1.2 m. Each piece keeps its size in `userData.spec`, and one function in the browser console measures them all in the scene:

```
window.misure = () => specs.map(g => {
  const r = g.rotation.y; g.rotation.y = 0; g.updateMatrixWorld(true);
  const b = new THREE.Box3(), s = new THREE.Vector3();
  g.traverse(o => { if (o.isMesh && !o.userData.decor) b.expandByObject(o);
}); b.getSize(s);
  g.rotation.y = r; g.updateMatrixWorld(true);
  const { name, L, W, H } = g.userData.spec;
  const err = Math.max(Math.abs(s.x - L), Math.abs(s.z - W), Math.abs(s.y -
H));
  return { name, catalogo: `${L} x ${W} x ${H}`, scena: `${s.x.toFixed(2)} x
${s.z.toFixed(2)} x ${s.y.toFixed(2)}`,
           scarto_cm: Math.round(err * 100) };
});
```

Run `misure()` after every change. Ours ended at 58 pieces and none more than 3 cm off. It caught a sofa that measured 93 cm high instead of 74, because of its decorative cushions.

THREE RULES FROM THE FIRST VERSIONS

- **Real sizes or nothing.** Furniture that is too small makes the whole house look like a toy, and the AI keeps it that way.

- **Big glass.** Floor-to-ceiling panels in one piece. In the 3D the glass is almost transparent, or the photo model invents what is outside.
- **Plants in pots, against the walls.** Never in the passages, where the camera walks.

CHAPTER 03

ONE RAIL FOR THE CAMERA

TWELVE STOPS, FIFTEEN SECONDS

The whole film is one camera move, and it is written in the same file: twelve stops joined by a smooth curve. `p` is where the camera stands, `t` where it looks.

```
path: [
  { p: [-28, FL + 1.3, 7.6], t: [-15, FL + 2.0, 7.2] },   // 1 in the foliage,
the gold door on the side
  { p: [-20.5, E, 7.3], t: [-14, FL + 1.8, 7.2] },        // 2 in front of the
open pivot door
  { p: [-13, E, 7.2], t: [-6, FL + 1.1, 3.5] },           // 3 in the double-
height hall, the living room ahead
  { p: [-7.6, E, 6.9], t: [-3.5, FL + 0.7, 0] },          // 4 past the sofa,
the pool beyond the glass
  { p: [-1, E, 6.9], t: [5, FL + 0.9, 4] },               // 5 beside the
dining table
  { p: [6.5, E + 0.15, 7.0], t: [12, FL + 0.9, 5] },      // 6 toward the
kitchen island
  { p: [11.5, FL + 2.0, 7.0], t: [14.5, FL + 0.6, 2] },   // 7 over the island
  { p: [14.0, E, 2.8], t: [13, FL + 0.6, -8] },           // 8 toward the open
kitchen glass
  { p: [13.4, E - 0.1, -1.7], t: [9.5, 0.5, -12] },       // 9 out on the
terrace
  { p: [11.6, 1.75, -6.4], t: [2, 0.3, -14] },            // 10 down the
steps, the pool
  { p: [12.5, 3.6, -14.5], t: [-2, 2.5, 0] },             // 11 the camera
turns back to the house
  { p: [14, 1.7, -21.5], t: [-2, 3.4, 3] },               // 12 the whole
villa from the lawn
],
pathTimes: [0, 0.06, 0.13, 0.22, 0.33, 0.43, 0.53, 0.62, 0.7, 0.79, 0.89, 1],
pathMm: 20, pathDur: 15,
```

`pathTimes` says when the camera reaches each stop, as a share of the 15 seconds: fast through the garden and the door, slow in the middle where the rooms are. The lens is 20 mm, the camera at eye height inside.

RECORD THE WALK

Claude renders the walk frame by frame in headless Chrome (Playwright), so the speed never depends on your computer: 450 frames, 1920 × 1080, 30 fps, 15 seconds. Two things to watch: wait about ten seconds before the first frame so every texture has loaded (unloaded walnut comes out black), and render in chunks of 80 frames if the browser crashes.

> Plan the rail on the rooms you will show, and only those. Photos of rooms the camera never crosses are credits thrown away: we made a bedroom, a bathroom and a hall, and none of them is in the film.

CHAPTER 04

THE MOTHER PHOTO

WORD FOR WORD

Before any video, one photo of the main room decides every material of the house. We made it on Higgsfield with Nano Banana Pro, 2K, 16:9. Image 1 is a screenshot of the 3D from the side entrance; images 2 to 7 are product photos: the grey sofa and the cognac armchairs, the chandelier, the bronze mesh screen, a sample of the Noce travertine and the onyx dining table.

PROMPT · NANO BANANA PRO · THE MOTHER PHOTO

```
EDIT Image 1. Image 1 is a 3D model of the living room of a villa in Camps Bay, Cape Town, seen from the side entrance: turn it into a real photograph of the same room. CAMERA LOCK: keep the exact camera, lens, height and framing of Image 1, aligned to the pixel, with every wall, window and piece of furniture exactly where it is and at the same size.
Floor: wide-plank fumed oak floor, oiled, deep honey-brown.
Left wall: book-matched walnut-brown Noce travertine slabs floor to ceiling, honed, open pores, copied exactly from Image 6, with a low walnut credenza and one large sculptural vessel in black clay on it.
Ceiling: a ceiling of fumed oak slats between dark plaster beams, 4 m high, only a narrow band of it at the top of the frame.
Windows: floor-to-ceiling glass in single uninterrupted panels 6 m wide, ultra-clear low-iron glass, slim dark bronze frames.
Sofa: the sofa from Image 2, copied exactly, a long low tailored sofa 360 cm with its chaise end, crisp straight cushions upholstered in fine wool in warm stone grey, slim dark bronze base, cushions in the same grey wool.
Armchairs: the pair of armchairs from Image 3, copied exactly, in cognac saddle leather on dark bronze swivel bases, facing the sofa.
Coffee table: a low rectangular coffee table 160 x 100 cm, top in honed Grigio Carnico dark grey marble with white veins, thin blackened steel frame; the table top is bare.
Light fixture: the sculptural chandelier from Image 4, copied exactly, dark bronze branches with hand-carved alabaster shades, hung above the coffee table; a slim floor lamp in dark bronze with an off-white linen shade at the end of the sofa.
Rug: a large hand-knotted wool and silk rug in charcoal and smoke grey under the whole seating group.
On the right: the tall screen of dark bronze mesh panels from Image 5, copied exactly, between the living room and the dining room; beyond it the oval dining table from Image 7, copied exactly, top in honey onyx on a dark bronze base, and the kitchen in walnut.
In the left foreground, slightly out of focus: one tall Strelitzia nicolai in a built-in honed travertine planter.
Outside the glass: a covered terrace in oiled teak, a pool lined in honed travertine with clear sand-coloured water, mature Canary Island date palms and Strelitzia nicolai planted in the ground, the Atlantic Ocean on the horizon under a clear afternoon sky.
Light: 3 pm, the sun low from the left beyond the glass, long soft shadows of the window frames across the oak floor and the rug, the room lit by daylight only, every lamp off.
```

```
Editorial architecture photograph in the spirit of Adam Letch, natural colour like
a Kodak Portra 400 film scan, gentle highlight roll-off, fine film grain.
```

The structure is what matters more than the words: **EDIT Image 1**, then **CAMERA LOCK**, then every surface named with its material and colour, the view outside, the light with the hour, and the photographic look last. Name every part, or the model fills the gap with its favourite room.

CHECK IT AGAINST THE 3D

We measure how many edges of the 3D screenshot come back in the photo. The approved mother photo scored 0.87. A photo that moves walls or furniture scores lower, and it goes back to the 3D, not into an edit.

THE LIGHT PASS

Once it was approved we redid it at 4K changing only the light. The same image goes in as Image 1:

PROMPT · NANO BANANA PRO 4K · ONLY THE LIGHT

```
EDIT Image 1. Image 1 is the approved photograph of this living room: keep it
identical, pixel for pixel, same camera, same framing, same furniture, same
materials, same colours, same view outside. Change only the light.
Light: clear afternoon sun at 3 pm streaming in through the floor-to-ceiling glass
from the left, natural daylight filling the whole room; warm sunlit patches on the
fumed oak floor and on the charcoal rug, long crisp shadows of the dark bronze
window frames and of the palm fronds stretching across the floor toward the
camera; soft bounce light lifting the walnut, the graphite sofa and the cognac
leather armchairs; deep natural shadows under the sofa, the armchairs and the
coffee table; the room lit by daylight only, every lamp off.
Editorial architecture photograph in the spirit of Adam Letch, natural colour like
a Kodak Portra 400 film scan, gentle highlight roll-off, fine film grain.
```

CHAPTER 05

THREE PHOTOS

CAMERA LOCKED

The film needs one approved photo for each part of the route it shows: the entrance, the living room and the outside. Each one is made from a screenshot of the 3D at that point of the rail, plus only material samples. Never give the model a photo of a whole other room as reference: it copies its layout.

THE 3D

APPROVED PHOTO 1 · THE ENTRANCE

PROMPT · THE ENTRANCE · IMAGE 1 THE 3D, IMAGE 2 THE MOTHER PHOTO

```
EDIT Image 1. Image 1 is a 3D model of the same villa in Camps Bay, Cape Town:
turn it into a real photograph. CAMERA LOCK: keep the exact camera, lens, height
and framing of Image 1, aligned to the pixel, with every wall, window, roof and
piece of furniture exactly where it is and at the same size.
Image 2 is the approved photograph of the living room of this same house: every
material, colour and finish comes exactly from Image 2 (wide-plank fumed oak
floor, ceiling and soffits of fumed oak slats, walnut-brown Noce travertine,
walnut joinery, slim dark bronze frames, graphite wool sofa, cognac leather
armchairs, Strelitzia nicolai and Canary Island date palms, the Atlantic beyond).
View: the side entrance of the villa, arriving along the garden path.
Entrance: a tall pivot door 1.8 x 3 m in fumed oak, standing open, slim dark
bronze edge; above it a thick canopy in brushed champagne bronze with a soffit of
fumed oak slats; two slim dark bronze wall lights either side of the door; through
the open door the entrance hall with its oak floor.
Walls: the two-storey side tower in walnut-brown Noce travertine, honed, open
pores, laid in large slabs; the upper floor in floor-to-ceiling glass with slim
dark bronze frames under a thick roof fascia in brushed champagne bronze; a teak
pergola on the roof terrace.
Courtyard: large-format honed Noce travertine pavers with open pores; one Agave
attenuata in a large honed travertine planter on each side of the door.
Planting: dense layered Cape garden right up to the courtyard, clumps of
Strelitzia nicolai, tree ferns, mature Canary Island date palms and umbrella
pines, unclipped, the grey rock face of the Twelve Apostles mountains above the
roofline.
Light: 3 pm, clear afternoon sun from the left, dappled shadows of the palm fronds
across the travertine.
Editorial architecture photograph in the spirit of Adam Letch, natural colour like
a Kodak Portra 400 film scan, gentle highlight roll-off, fine film grain.
```

The entrance scored 0.86 against its 3D.

THE 3D

APPROVED PHOTO 2 · THE LIVING ROOM

PROMPT · THE LIVING ROOM · IMAGE 1 THE 3D, IMAGES 2 AND 3 MARBLE AND TRAVERTINE SAMPLES

EDIT Image 1. Image 1 is a 3D model of a long living room in a villa in Camps Bay, Cape Town: turn it into a sharp, high-resolution real photograph. CAMERA LOCK: keep the exact camera, lens, height, perspective and framing of Image 1, aligned to the pixel. The room keeps exactly the long deep proportions of Image 1: the oak floor runs far into the distance, the bronze screen stays in the middle distance, the dining room and the kitchen stay small at the very far end; every wall, window, opening and piece of furniture stays exactly where it is and at the same size as in Image 1. Image 2 is only a sample of Verde Guatemala marble and Image 3 only a sample of Noce travertine.

Left foreground, same position and same L shape as the grey sofa in Image 1: a long low tailored sofa like Minotti Hamilton in ivory heavy wool, slim dark bronze base.

Centre foreground, same positions as the two boxy armchairs in Image 1: two low sculptural armchairs like Minotti Daiki in black suede on dark walnut frames.

Coffee table, same position: a low rectangular coffee table, top a thick slab of polished Verde Guatemala dark green marble from Image 2 on a thin dark bronze frame; the top is bare.

Above it: the sculptural chandelier of Image 1 in dark bronze with alabaster shades. Rug: a large hand-knotted rug in smoke grey under the seating.

Right wall: walnut-brown Noce travertine slabs from Image 3 floor to ceiling, the large black TV recessed in the stone exactly where it is in Image 1, and below it a linear fireplace built into the stone wall, the flame set deep inside a recessed opening flush with the travertine, the low travertine bench in front exactly as in Image 1.

Middle distance: the tall screen of dark bronze mesh panels and the dark bronze sculpture on its travertine plinth, exactly as in Image 1.

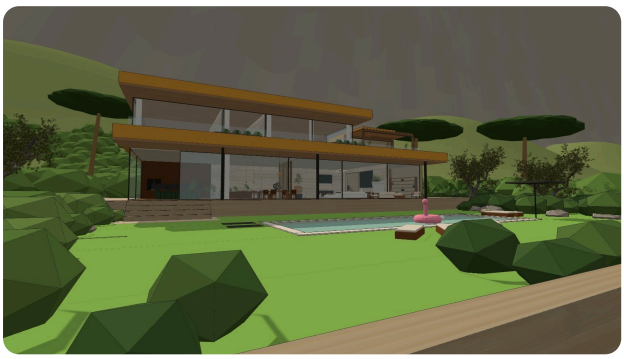

Far end, small but sharp: the dining table with dark walnut chairs, and the kitchen with an island clad in Verde Guatemala marble and a full-height wall of dark walnut units with black ovens.

Plants inside: a tall Strelitzia nicolai in a large travertine planter by the glass on the left, a large Alocasia in a dark clay planter at the end of the sofa, two Kentia palms in tall travertine planters at the far end beside the kitchen, a tree fern in a stone planter beside the bronze screen.

Floor: wide-plank fumed oak floor, oiled, deep honey-brown. Ceiling: fumed oak slats, 4 m high.

Windows on the left: floor-to-ceiling glass in single panels with slim dark bronze frames. The view outside the glass is a real, sharp, detailed garden: an oiled teak terrace, a bright green lawn, a travertine-edged pool with clear pale jade

water, mature Canary Island date palms with natural arching fronds, soft layered Strelitzia nicolai and silver-green fynbos, and the Atlantic Ocean on the horizon under a clear blue sky. The green blocky shapes outside in Image 1 are only placeholders for this garden.
Light: 3 pm, sun low from the glass on the left, long shadows of the window frames across the oak floor and the rug, daylight only, every lamp off.
Editorial architecture photograph in the spirit of Adam Letch, natural colour like a Kodak Portra 400 film scan, gentle highlight roll-off, fine film grain.

THE 3D

APPROVED PHOTO 3 · THE OUTSIDE

PROMPT · THE OUTSIDE · IMAGE 1 THE 3D, IMAGE 2 A TRAVERTINE SAMPLE

EDIT Image 1. Image 1 is a 3D model of a modern villa in Camps Bay, Cape Town, seen from the garden across the pool, with the Twelve Apostles mountains behind: turn it into a sharp, high-resolution real photograph. CAMERA LOCK: keep the exact camera, lens, height and framing of Image 1, aligned to the pixel; the house, the steps, the pool, the sunloungers, the towels, the parasol and the flamingo stay exactly where they are and at the same size. Image 2 is only a sample of the walnut-brown Noce travertine.
The blocky green shapes in Image 1 are only placeholders: render all planting as real, soft, natural vegetation.
House: two floors with thick roof fascia bands in brushed champagne bronze and soffits of fumed oak slats, a side tower clad in walnut-brown Noce travertine from Image 2 on the far left. GROUND FLOOR: the whole ground floor facade, from the travertine tower on the left to the far right end, is floor-to-ceiling glass in tall single uninterrupted panels of ultra-clear low-iron glass with very slim dark bronze frames, exactly as the glass in Image 1; there is no solid wall, no wood panel and no stone section between the glass panels. Only the leftmost glass panel in front of the kitchen is slid fully open. Through the glass: the walnut kitchen on the left, the dining table in the middle, the living room on the right. UPPER FLOOR: floor-to-ceiling glass with slim dark bronze frames and a glass balustrade, a teak pergola on the roof terrace on the right.
Terrace and steps: an oiled teak deck along the house and four wide honed travertine steps down to the lawn on the left.
Garden: a lush, even, bright green kikuyu lawn covering the whole garden right up to the pool on every side.
Pool: a long rectangular pool lined in honed travertine, framed only by a narrow flush honed travertine coping, the water clear and pale jade.
On the grass near the steps, on the left side of the pool: two large beach towels in charcoal with off-white stripes spread flat on the grass, side by side, their long sides parallel to the pool, facing the water.
On the right, on the lawn in front of the pool: four Kettal Bitta sunloungers in dark teak with charcoal cushions, placed casually at slightly different angles,

```
one with a folded charcoal towel on it; further back on the far right two more
sunloungers under a large square parasol in graphite canvas.
In the pool: one large inflatable pink flamingo float and a small white beach
ball.
Planting: mature Canary Island date palms with full arching fronds and textured
trunks on the left edge and on the right edge, deep layered borders of Strelitzia
nicolai, tree ferns, agaves and silver-green fynbos around the lawn, Mediterranean
umbrella pines behind the house; behind everything the grey rock face of the
Twelve Apostles.
Light: 3 pm, clear afternoon sun from the left, long crisp shadows of the palms
across the lawn, the glass reflecting the sky and the garden.
Editorial architecture photograph in the spirit of Adam Letch, natural colour like
a Kodak Portra 400 film scan, gentle highlight roll-off, fine film grain.
```

> Look at the lines that say **“are only placeholders”**. The blocky trees of the 3D come back as blocky trees unless you say what they stand for. For the same reason we hid the 3D palms in the screenshots and wrote the palms into the prompt.

CHAPTER 06

THE 3D GETS

WHAT THE PHOTOS HAVE

Once the three photos were approved, the 3D was furnished to match them: the ivory sofa, the black armchairs, the green marble table and island, the fireplace in the stone, the towels and the flamingo by the pool. Nico's rule: the 3D must have the same things as the photos, inside too.

Then Claude recorded the walk again from the same rail: 450 frames, 1920 × 1080, 30 fps, with real textures and with the blocky 3D palms hidden. That file is the one Seedance follows. The closer the 3D is to the photos, the less the video model has to invent.

CHAPTER 07

THE WALK
ON SEEDANCE 2.5

One generation, one take, no cuts. These are the settings we used:

SETTING	VALUE
Model and mode	Seedance 2.5, omni reference
Video reference	the 3D walk from chapter 06
Image references	1 the entrance, 2 the living room, 3 the outside
Length, format, audio	15 s, 16:9, audio on
First the draft	480p, 45 credits
Then the final	1080p from the same draft, 240 credits: 1920 × 1080, 24 fps

Make the draft first and look at it from start to end: if the route, the rooms and the timing are right, ask for the 1080p version of that same draft, and you pay the expensive one only once.

PROMPT · SEEDANCE 2.5 · DRAFT AND FINAL, THE SAME TEXT

```
One continuous handheld-smooth single take, no cuts, no people. The camera follows
exactly the path, speed and framing of Video 1, frame by frame: Video 1 is a grey
3D model and gives only the camera movement and the position of every wall,
opening, piece of furniture and object. Every surface, material, piece of
furniture, plant and the light come from the three approved photographs: Image 1
for the entrance, Image 2 for the living room, dining room and kitchen, Image 3
for the garden, the pool and the facade. The blocky green shapes and the angular
trees in Video 1 are only placeholders for the real planting of Images 1 and 3.

0.0-1.0 s: we glide out of lush Strelitzia nicolai, tree ferns and agaves toward
the side entrance of the villa: walnut-brown Noce travertine wall, the tall fumed
oak pivot door standing open under its champagne bronze canopy with oak slats, two
dark bronze wall lights, two agaves in travertine planters, exactly as Image 1.
1.0-2.0 s: we pass through the open pivot door into the double-height entrance
hall in travertine and oak.
2.0-3.3 s: through the wide opening the long living room appears straight ahead,
full of afternoon light.
3.3-5.0 s: we move past the living room of Image 2: the ivory L-shaped sofa, the
two black suede armchairs on walnut frames, the Verde Guatemala green marble
coffee table, the bronze and alabaster sculptural chandelier, the travertine wall
with the black TV and the fireplace with a live flame set into the stone, floor-
to-ceiling glass on the left with the pool, palms and the Atlantic.
5.0-6.5 s: we slide past the bronze mesh screen and the bronze sculpture on its
travertine plinth, the dark walnut dining table with slatted walnut chairs under
two slim bronze pendants.
6.5-8.0 s: we approach the kitchen of Image 2: the island clad in Verde Guatemala
green marble, the full-height wall of dark walnut units with black ovens, Kentia
```

```
palms in travertine planters.
8.0–9.3 s: the camera glides slowly over the green marble island.
9.3–10.5 s: we turn toward the open glass panel of the kitchen, the terrace and
the garden bright beyond it.
10.5–11.9 s: we step out onto the oiled teak terrace under the deep oak-slatted
overhang.
11.9–13.4 s: we go down the wide travertine steps onto the lawn; the pool opens up
with the pink flamingo float and the white ball, the two striped towels on the
grass, the dark teak sunloungers with graphite cushions and the graphite parasol,
as Image 3.
13.4–15.0 s: the camera turns back and settles on the whole villa exactly as Image
3: the glass ground floor, the champagne bronze fascias, the travertine tower, the
umbrella pines, the palms and the rock face of the Twelve Apostles behind.

Light: 3 pm, clear afternoon sun, long soft shadows of palms and window frames,
natural colour like a Kodak Portra 400 film scan, gentle highlight roll-off, fine
film grain. Steady, smooth, cinematic gimbal movement, no shake, no flicker, no
morphing of furniture.
Audio: soft natural ambience, wind in the palms, distant waves, birds.
```

The prompt calls Video 1 a grey 3D model even though ours had textures: what counts is that it tells Seedance to take only the movement and the positions from the video, and everything you see from the photos. The timeline matches the `pathTimes` of chapter 03, second by second.

CHAPTER 08

TRIM, GRADE
AND SIZE

The first eight frames of our take (a third of a second) still showed blocky green plants, so we cut them, sound included. Then a light grade: a first, stronger one looked too bright and saturated, and this softer one is what went out. These are the filters we used, in one command:

```
ffmpeg -i seedance_1080p.mp4 \
  -vf "trim=start_frame=8,setpts=PTS-STARTPTS,\
curves=master='0/0.01 0.25/0.235 0.5/0.5 0.75/0.765 1/0.99',\
eq=saturation=1.07,vibrance=intensity=0.1,\
colorbalance=bs=0.02:rh=0.012:bh=-0.01,vignette=angle=0.25,\

```

> Be honest with your client about the last line: `scale=3840:2160` enlarges the 1080p film to a 4K file for the reel and the big screen, with a little sharpening. It is not a native 4K render. Our final file: 3840 × 2160, 24 fps, 14.71 seconds.

CHAPTER 09

THE 3D AND FILM SPLIT

THE REEL THAT GETS THE COMMENTS

The reel works because the viewer sees the same camera move twice, once in the 3D and once in the film. For that the two have to match frame by frame, and Seedance never follows the 3D exactly: ours ran about 0.85 seconds ahead in the kitchen, made the island longer and hid part of the living room on the way in.

So we went the other way and moved the 3D to the film:

1. Claude compared the frames of the film with the frames of the 3D to find the timing. The automatic search did not find the camera, so the keys up to 10.5 seconds were set by hand, then the original rail took over with the new timing.
2. The keys were smoothed with no overshoot and the turn capped at 75° per second, which cured a jerky back and forth over the island.
3. The model itself changed to match what the film shows: the island became 6 m long, the table moved, the armchairs moved 60 cm, four seats took the place of the stools.
4. The new 3D walk was recorded at 24 fps, 14.71 seconds, the same as the film, then once more in plain white for the reel.

With two files of the same length, the cut is yours: half and half on screen, a line that wipes from the 3D to the film, or the white 3D first and the film after. Nico cut ours himself.

THE 3D MOVED TO THE FILM

THE FILM, SAME FRAME

CHAPTER 10

THE CHECKS

BEFORE IT GOES OUT

1. `misure()` in the console: every piece within 3 cm of its size.
2. Every stop of the rail shows something different: no two stops that look the same.
3. Each photo against its 3D: the walls and the furniture where they were. Ours scored 0.86 and 0.87.
4. Plants only in pots against the walls, never in the passages.
5. Lawn all round the pool, stone only on its edge.
6. Towels facing the pool, never the camera.
7. Glass across the whole ground floor where the 3D has glass, and the fireplace set into the stone.
8. Photos only of the rooms the camera crosses.
9. The draft watched from start to end before you pay for the 1080p.
10. No text, logo or watermark in any frame.

CHAPTER 11

WHAT WENT WRONG
AND THE FIX

WHAT HAPPENED	WHAT FIXED IT
Whole-room photos as references: the model copied their layout.	Only the 3D and material samples, the furniture described in words.
Editing a photo that was already edited: it came back grainy.	Generate again from the 3D, in one pass.
The blocky 3D palms came back blocky.	Palms hidden in the 3D, and “only placeholders” in the prompt.
Asked to swap the front loungers for towels, it removed every lounger.	Say what stays as well as what changes.
Green blobs in the first frames of the film.	The first eight frames trimmed.
The film ran ahead of the 3D and invented a longer island.	The 3D moved and rebuilt to match the film (chapter 09).
Walnut rendered black in the 3D walk.	Wait ten seconds for the textures before the first frame.
The browser crashed on long renders.	Render in chunks of 80 frames.

If you want us to make it for one of your houses, write to us from omnyalab.com with the plans or the 3D you have.

omnya lab

YOUR TURN

MAKE YOUR 3D A FILM

You have the house in code, the rail, the three photos, the film and the split. Send the film to the developer before the launch and put the split in every reel: that is where people stop scrolling and ask how.
