FREE BLUEPRINT

STEAL OUR BUILD METHOD

5 STEPS, FREE

FROM ONE PHOTO TO A HOUSE
THAT BUILDS ITSELF

OMNYA LAB

THE RESULT

HOLD IT, IT BUILDS

A house that goes from a blueprint on the desk to the finished home while you scroll or hold the screen, and the camera turns around it all the way. Nine phases, one camera, every frame lined up with the one before.

No SketchUp, no Blender, no 3D artist: Claude wrote the 3D in code and it runs in the browser. This blueprint shows you the five steps and how each prompt starts.

STEP 01

ONE PHOTO SETS THE HOUSE

Everything starts from one photo of the finished house, slightly from above and with room around it, because that is where the camera will start and end.

PROMPT 1 **NANO BANANA PRO · THE HOUSE**

```
Architectural photograph taken from a slightly raised
position, about three metres above the ground, with a 28mm
lens: a three-quarter view of a finished two-storey American
colonial house standing in a wide clearing deep in a tall
American forest, with very tall oaks, maples and white pines
surrounding the clearing on every side and rising well above
the roofline behind the house. Timber-framed house with white
```

Every prompt, whole, is in the Full Blueprint

STEP 02

THE HOUSE IN CODE

Claude Code copies the photo in three.js, then turns the camera around it on one rail, so every phase of the build gets its own screenshot from the same lens and the same height.

PROMPT 2 — **CLAUDE CODE · THE 3D**

```
Copy the house in this photo in three.js, in real metres: a
two-storey American colonial with white horizontal lap
siding, a steep dark shingle roof with the central gable and
two dormers, the brick chimney on the left, the white porch
with columns, the garage wing on the right, in a clearing of
tall oaks and pines.
```

The whole prompt and the file are in the Full Blueprint

STEP 03

EVERY PHASE
CAMERA LOCKED

The 3D screenshot goes in as Image 1 and nothing else: when we added the photo of the finished house as a second reference, the camera jumped back to it every time.

PROMPT 3 **NANO BANANA PRO · ONE PHASE**

```
Image 1 is a 3D screenshot. CAMERA LOCK: keep exactly the
camera, the framing, the lens and every line of the building
from Image 1, do not move anything.

Turn it into a real photograph of the same house at this
stage: the timber frame fully up on the concrete foundation,
studs, joists and roof trusses in fresh yellow pine, no
```

The nine phase prompts are in the Full Blueprint

STEP 04

ONE CLIP PER PHASE

Each photo is the end of one clip and the start of the next, so nine phases become nine short clips on Kling with a start frame and an end frame, and played one after the other they look like a single move around the house.

We check the last frame of every clip against the next photo before going on, because one wrong turn of the camera shows straight away.

→ The clip settings and the checks are in the Full Blueprint.

STEP 05

HOLD TO BUILD

The clips become frames, the frames go on a canvas, and the page plays them while you scroll or hold the screen, with the name of each phase coming in on top.

Try it on your phone at omnyalab.com/demo/hold-to-build. How to compress the frames, make it open fast on a phone and hand it to a client is in the Full Blueprint.

THE FULL BLUEPRINT · €5.99 INSTEAD OF €29

HOW TO BUILD A HOUSE

THAT BUILDS ITSELF

00 The fast way: hand it to Claude Code

01 The photo that sets the house

02 The house in code

03 The rail and the screenshots

04 The phases, backwards

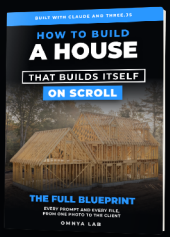

05 Nine photos, camera locked

06 Nine clips, start and end

07 Frames light enough for a phone

08 The hold to build page

09 Delivery and what to charge

YOUR TURN

BUILD YOUR HOUSE

The Full Blueprint has every prompt whole, the 3D file, the page and the way we hand it to a client. **€5.99 instead of €29, and only on our page.**
