

The reel they comment on

For creators and the AI curious

The reel they comment on

Our most watched reels all work the same way: a white 3D that turns real while you watch. Here is every step with the credits it costs, so you can make your own without burning money on tests.

3D model

Final image

Why this format

On 29 October 2026 our account had 59 followers. Our two 3D-to-real reels had 4,325 and 1,706 views, and our atmosphere reels between 150 and 470. Small numbers, but the gap was roughly ten to one, so we moved the whole account to this format.

What you need

Claude to build the 3D and the ride through it, Higgsfield for the photos and the clips, an editor for the cuts and ManyChat for the comment-to-DM. No SketchUp, no render engine.

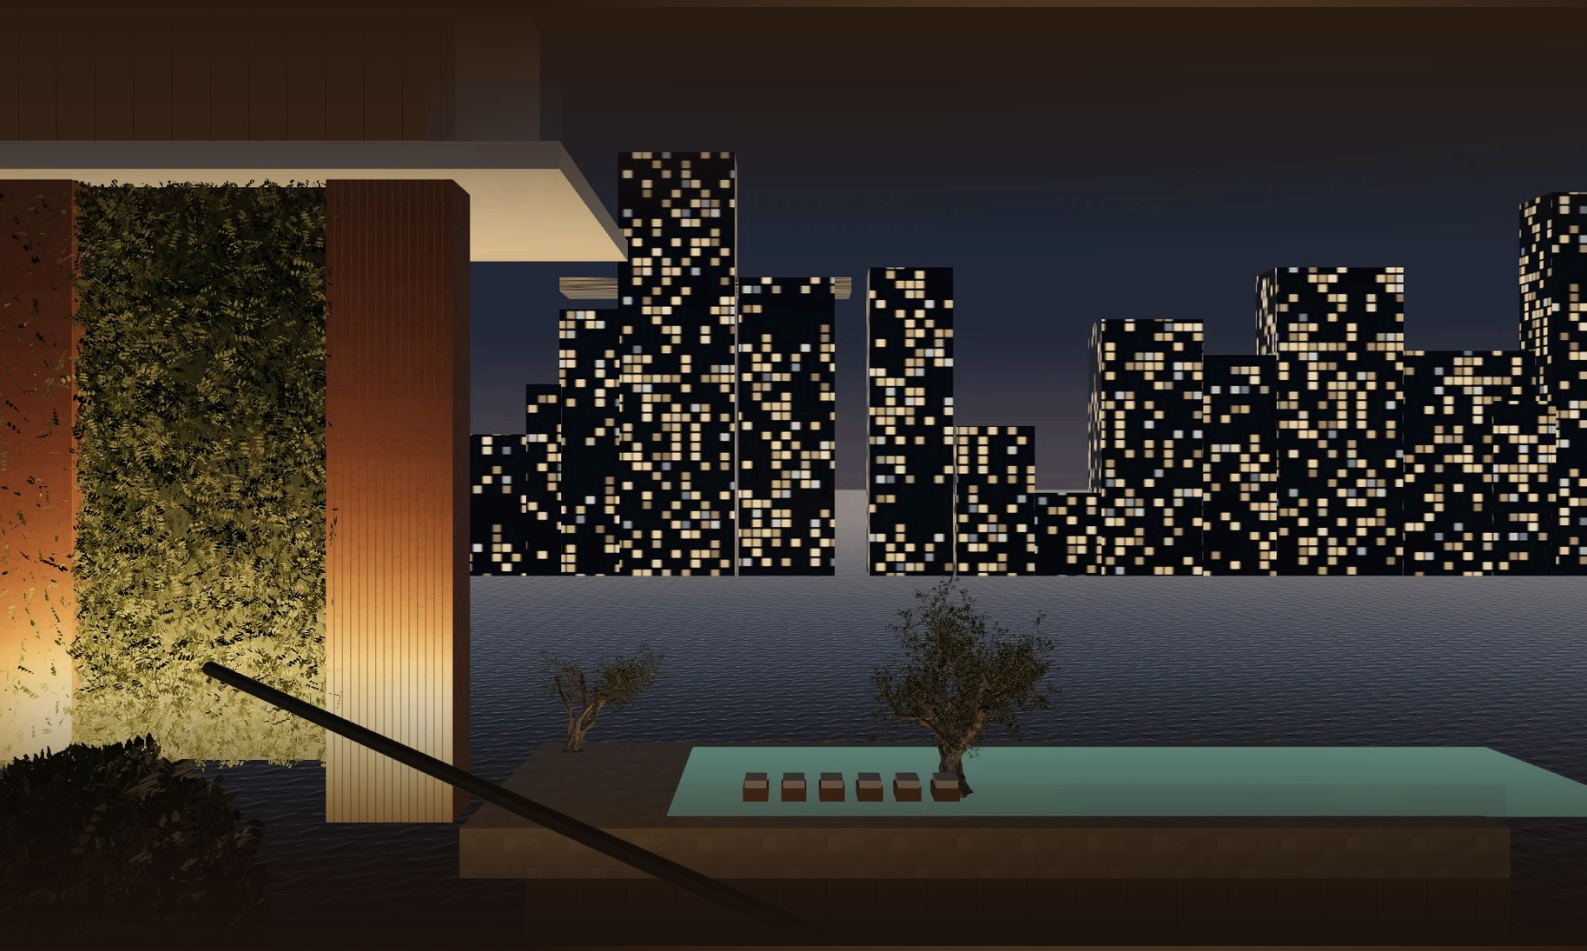

01 The 3D walk-through Claude builds

02 From frame to photo, from photo to clip

03 Real credit costs per clip

04 The hook, the cuts and the cover

05 Comment a word, get a DM

Chapter 01

The walk-through Claude builds in 3D

A reel is a ride of 12 to 15 seconds through a house: in from the garden, through the living room, past the kitchen, out to the pool. Claude builds the house and the ride, and you decide how every shot looks.

Start from the house not from the camera

Pick three or four reference photos of the kind of house you want, then describe it to Claude in metres: the plot, the rooms the ride goes through, the heights, the glass, the furniture with catalogue sizes. Model only the rooms the camera passes through. On our Cape Town villa we built a bedroom, a bathroom and a corridor the video never entered, and that was a day gone.

Prompt — Claude

Build a modern villa on a slope above the sea in three.js, in a single HTML page, units in metres, following the references I attach. Ground floor only, on the path of the camera: entrance on the side of the house, a living room 10 × 7 m with a 4 m TV wall in stone, a dining table for ten, a kitchen with an island 4 m long, and a glass wall that opens onto a lawn with a pool 12 × 4 m. Floor-to-ceiling glass in single panes at 16% opacity, ceiling 3.2 m. Furniture at real catalogue sizes, every piece within 3 cm. Plants only in pots against the walls, never in the way of the camera. Sun from the west at five in the afternoon.
List the size of every piece in the console so I can check it.

The ride

Once the house is right, ask for a camera path through it and a way to record it. In 12 to 15 seconds there is room for three or four rooms of about four seconds each. Start a little faster, then slow down in the middle, where the best room is.

Prompt — Claude

Add a smooth camera path through the house at eye height, 1.6 m, 24 mm lens: from behind the leaves at the side entrance, through the door, along the sofa, over the end of the kitchen island, out through the open glass and down to the pool, then turning back to see the villa from the lawn. Total 15 seconds, quicker at the start and slower in the living room.
Add a key that plays the path and records it as an MP4, 1920 × 1080 at 30 fps. Keep the vertical lines straight the whole time.

With Claude Code on your computer the recording saves straight to your folder. In claude.ai, where downloads are blocked, record the screen with your computer's own recorder.

Make every shot different

The first versions of our houses got rejected for the same reason: small furniture, windows split into stripes and every frame looking like the one before. These are the rules we work with now.

1. **Every beat of the ride shows something new.** We compare the frames two by two, and when two beats look alike we move the camera, not the furniture.
2. **Change the height and the side.** One room low, one through a doorway, one along the island, one out of the glass.
3. **Something close to the lens.** Leaves, the edge of a door, the back of a chair, so the camera has depth to move through.

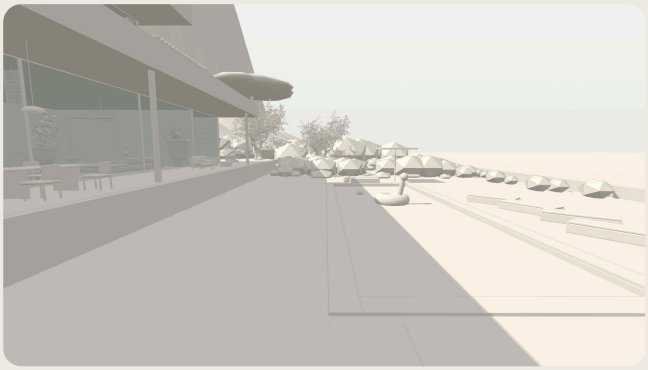

4 **Glass in single giant panes.** Glass split into stripes reads as an office.

5 **Real rooms, full.** Rugs, lamps, a big TV in the living room, a few things on the shelves. An empty 3D comes back as an empty photo.

Ride, second 2

Ride, second 12

Chapter 02

From frame to photo from photo to clip

Higgsfield turns the frames of your ride into photos, and the photos into clips with Kling and Seedance. There are two roads, one clip per shot or one video for the whole ride, and they cost very differently.

Frame to photo on Higgsfield

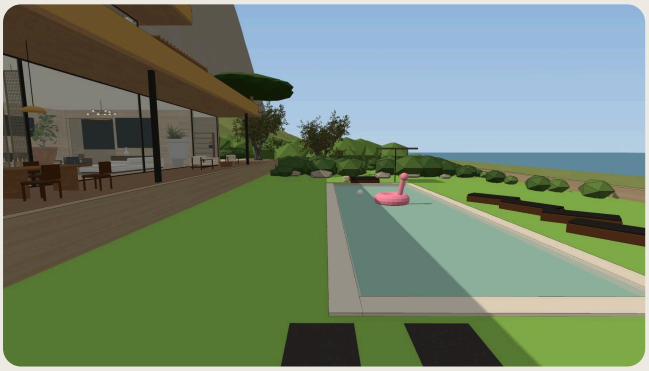

1 **Screenshot the key frames** of the ride, one for each room, at 16:9 or 9:16, the same format you will post.

2 **Make the master first.** Take the strongest frame and turn it into a photo with Nano Banana Pro: the frame as image 1, one real sample per material, and the prompt from Playbook 01. Fix the style on this one view before you touch the others.

3 **Then the other rooms,** each with its own frame as image 1 and the approved master as a style reference, so the materials stay the same from room to room.

4 **One image per send.** On our plan Nano Banana Pro runs in Unlimited only with one image per generation; at two or four it switches to credits. Check that Unlimited is on before every send, because a page reload turns it off.

Frame

Photo

Road A one clip per shot, with Kling 3.0

Each approved photo becomes the first frame of a short clip. Kling 3.0 takes a start image and, if you want, an end image. One slow camera move per clip, three or four seconds each, then you cut them together. A fast or combined move bends the walls and shows the AI.

Formula — Kling 3.0 · pro · sound off

The reference image is the first frame; keep the room layout, the furniture and the materials exactly. Only the camera moves: one slow move, from where to where. Keep all vertical lines straight. What moves in the scene: water, palm leaves, a curtain. What stays out of focus in front.
Smooth stable camera, real speed, no particles, no sparkles, no glitter, no magic effects.

The last sentence is the one place where we write a "no": video models add sparkles and floating dust on their own, so we say it out loud. Some moves that worked on our villas:

Shot	Prompt
Pool	“Low slow dolly forward over the pool edge toward the house. The pool water is perfectly calm, a still mirror with soft reflections. Palm leaves move gently in the breeze.”
Entrance	“Slow dolly forward into the entrance hall past the out of focus door edge in the foreground, with a gentle arc to the right and a slight rise, strong parallax and depth.”
Kitchen	“Slow lateral tracking shot to the left passing behind the out of focus palm leaves in the foreground, revealing the whole kitchen island and the open glass wall to the sea.”
Detail	“Very slow macro slide along the veins of the quartzite countertop toward the bronze tap, soft sunlight moves across the stone.”

Road B the whole ride at once, with Seedance

Seedance takes video references as well as images. You give it the recording of your 3D ride as the video reference, so it copies the camera move and the geometry, and the approved photos of each room as image references, so it copies the materials and the light. This is how we made the Cape Town reel.

- **Run a draft at 480p first.** It costs less and tells you if the move and the rooms hold. Only then render at 1080p.
- **A photo for every room** the ride passes through. A room without its photo changes material halfway.
- **Up to 15 seconds** in one go. Longer rides are two videos cut together on a door or a wall.

> **Which road?** Road A costs little and gives you control shot by shot, but the cuts show. Road B gives you the continuous ride that people watch twice, at a much higher price per second. Our advice is to learn on A and keep B for the reel you want to push.

Chapter 03

Real credit costs per clip, before you spend

These are the credits we paid on our own projects in October 2026, checked again on Higgsfield on 1 November, with the date and source of each number. Prices change, so look at the number on the Generate button before you press it.

What it costs on Higgsfield, autumn 2026

What	Settings	Credits	From
Photo, Nano Banana Pro	2K, one image per send, Unlimited on	0	Our plan
Photo, Nano Banana Pro	2K, outside Unlimited	2	Paid, 27 Oct
Photo, Nano Banana Pro	4K	4	Paid, 29 Oct
Clip, Kling 3.0	1080p, sound off, 4 s	6	Read on the button, 1 Nov
Clip, Kling 3.0	1080p, sound off, 3 s	4.5	Paid, 20 Oct
Clip, Kling 3.0	4K, sound off, 4 s	24	Read on the button, 1 Nov
Video, Seedance 2.0	4 s, 720p	18	Read on the button, 1 Nov, discounted from 24
Video, Seedance 2.5	5 s, 1080p, with references	80	Read on the button, 1 Nov
Video, Seedance 2.5	15 s, 1080p, video reference	240	Paid, 29 Oct (16 a second)

"Paid" is what our own projects cost. "Read on the button" is the number Higgsfield showed next to Generate on 1 November 2026, without generating. Kling 3.0 offers 3 to 15 seconds, 720p, 1080p or 4K, and sound on or off; sound off costs less.

What a reel costs worked out from the table

Reel of 15 seconds	How	Credits
Road A	5 photos in Unlimited, 4 Kling clips of 4 s (4 × 6)	24
Road A with redos	the same, plus our redo budget of 25	49 at most
Road B	5 photos in Unlimited, one Seedance video at 1080p	240, plus the 480p drafts

On a plan with 6,000 credits a month, which is ours, a 1080p Seedance ride uses 4% of the month, and a Road A reel less than 1%.

The rules that keep the bill down

- **A budget before you start:** number of clips × 6, plus 25 for the redos. If the estimate goes over, stop and decide.
- **Two redos per clip at most.** If the third doesn't work, keep the best one and move on, or change the move.

- **Always 1080p, sound off, never 4K** for clips that end up in a 1080 × 1920 reel: on Kling 3.0 the 4K costs four times as much. Add music in the edit.
- **No presets.** They change the look of the photos you worked on.
- **Photos in Unlimited, one per send.** Tests are free there, so all the trial and error happens on the photos, never on the clips.

When a clip goes wrong

Problem	Fix
Furniture melting	A shorter, softer move: from an orbit to a short push in
Doors or windows bending	Less distance travelled; a sideways slide holds better than a push
The room changes	Repeat “keep the room layout” and animate only camera and light
The clip feels frozen	Add one living thing: a curtain moving, palm leaves, water
A view keeps failing	One more try, then skip it and use another shot

Chapter 04

The hook, the cuts and the cover

Most people decide in the first second. The hook gets them to stay, the cuts keep them to the end, and the cover decides whether they open it from your grid.

The hook the first second

Open on the strongest thing you have, which in this format is the moment the 3D turns real. If the reel starts with words, use one sentence on a clean background, written to the person watching. Never a logo, never a slow fade from black.

The line on screen says what the viewer gets, not how you made it. Lines that worked for us on covers and openings:

None of this
is real

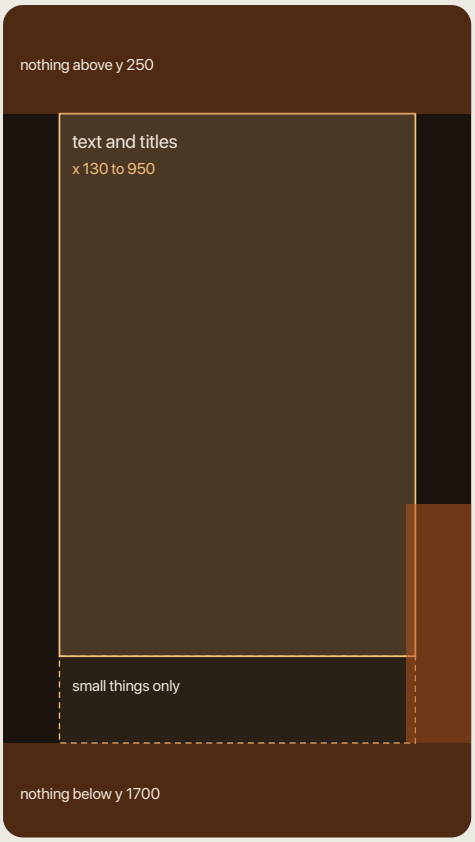

A whole home in
2 days

And lines we dropped because they talk about the process: “One line”, “From one line to the final image”, “Every home starts as a drawing”.

The cuts on the beat

- **Write the beat grid before you cut.** If the drop falls at 8.95 s and a beat lasts 0.4475 s, beat n falls at 8.95 + 0.4475 × n. Every cut and every word lands on one of those.
- **A cut every two beats** in the fast part. To shorten a slow passage, cut whole beats from the video and the same number from the music.
- **Each line of text lives alone:** it arrives, it’s read, it leaves before the next thing comes in.
- **Reading time beats length.** A label stays at least 1.5 s, a closing line 2 s after its last word, the final card with the address 2.5 s.
- **No dead time.** After the last line, the scene leaves within about a second.

Where text can go on a 1080 × 1920 reel

Long phones zoom the reel and cut about 45 px on each side. On the right there is the column of likes and comments, at the bottom the name, the audio and the caption.

- Every word stays between x 130 and x 950.
- Nothing above y 250.
- Important text above y 1500, small things up to y 1700, nothing below.
- Nothing that matters in the right column, x above 930 between y 1150 and 1700.

Pictures and clips can go to the edges. Words can't.

The cover

- **Two lines:** a small one that leads in, and one big word that is the promise. The linking words go in the small line.
- **The sizes we use** on 1080 × 1920: small line semibold at 78 px, big word bold at 300 px, never wider than 820 px. If it doesn't fit, change the word, not the size.
- **The subject in front of the big word:** the roof of the villa or the edge of the model covers 20 to 30% of its height, never more. It makes the cover look three-dimensional in the grid.
- **The grid shows 3:4.** Keep title and subject between y 240 and y 1680, or the profile cuts them.
- **The strongest photo of the reel,** full page and sharp.

Chapter 05

Comment a word get a DM

The end of the reel asks for one word in the comments, and a DM arrives with something worth having. Here is the setup in ManyChat, the messages we send and the limits nobody tells you about.

Why a word in the comments

A link in an Instagram caption can't be clicked, so "link in bio" asks people to leave the app and type. A word in the comments is one tap, and the DM brings a link that works. Metricool studied 24.4 million Instagram posts from January and February 2025 and 2026 and reported, in June 2026, that posts with a call to comment got 202.78% more comments, and posts with a question 36.70% more.

> **Instagram's own line.** In June 2024 Instagram said that asking people to comment a word only to inflate engagement can stop a post from being recommended, that creators can still use tools like ManyChat, and that answering in DMs to send something real or start a sale is not engagement bait. So the DM has to deliver what the reel promised, every time.

The setup in ManyChat

1. **Connect your Instagram professional account** to ManyChat.
2. **New automation, trigger "Instagram post or reel comments".** Choose the reel and the keyword. ManyChat ignores capital letters; add the variants people will type, like RENDER and RENDERS.
3. **Public reply on, with two or three versions** that rotate, so it doesn't look like a bot: "Sent, check your DMs." / "It's in your inbox."
4. **DM 1 with a button.** The tap opens the conversation and makes the next message land. The link comes after the tap, never in the first message.
5. **DM 2 with the link** to the PDF or the page, with a tag at the end to count visits on your site: `?utm_source=instagram&utm_medium=manychat&utm_campaign=word` .
6. **A follow-up after 23 hours** to whoever didn't tap, inside the 24-hour window.
7. **Test it from a personal account** before you post.

The messages we send

DM 1 — button: Send me the PDF

Hi, it's Nico from Omnya Lab 👋 You asked for the Blueprint, the four steps we use to turn a rough 3D into a real photo (it's free, no catch). Tap below and it's yours.

DM 2 — after the tap

Here it is: omnyalab.com/learn. The last page takes you to the full method, and if you want to try it on one of your projects, the first image is on us. Just reply PROJECT and I'll ask you three quick questions.

Follow-up — after 23 hours, only if no tap

Still here if you want the Blueprint, no rush. Tap the button above whenever you like.

The limits

- **One trigger per person per post.** If someone comments the word twice, the second time nothing happens. Make the first DM count.
- **A 24-hour window** to write to someone after they comment.
- **One action per DM.** Asking for the email, a follow and a like in the same message gets you none of the three.
- **The word must match the reel.** PROJECT under a reel about a project, RENDER under a reel about renders. People comment what they want to receive.

ManyChat counts triggers, taps and clicks; the tag in the link tells you how many reach your site. Watch those three numbers for four weeks before you change the word or the messages, and change one thing at a time.

The ManyChat limits above come from secondary sources that quote ManyChat's help pages, which we couldn't open. Check them in the trigger settings when you set it up.

Make the first one with us

If you want to see it done on your own house, from the 3D to the clip, or you'd rather have us make it, here is what we do.

Step	Price	What you get
Session, 60 min	€190	One to one on your project. You leave with your first image, the prompt file for your project and the recording.
Build, 3 hours	€490	The method set up on your Claude and Higgsfield accounts, 5 finished images, one 10-second clip, the recordings and 7 days of questions on WhatsApp.
All three playbooks	€79	The three PDFs with the full prompt files and the checklist we run before every delivery. One by one they cost €107.
