From a 3D model to a real photo.

This is the workflow behind the video: a rough 3D model of a space turned into a photorealistic image. No SketchUp, no render farm. The 3D is built with Claude, the realism comes from Higgsfield.

3D · CLAUDE

FINAL · HIGGSFIELD

01 Describe the space

Write down what you want: room, size, materials, light, style. A plan, a sketch or a photo of the empty room helps a lot.

02 Build the 3D with Claude

Ask Claude (Claude Code) to model the room in a browser 3D scene. Walls, openings, furniture, real proportions. You move the camera, ask for changes in plain words, and export the view you like.

```
Build a 3D model of this room in three.js, in real meters: 6 x 4.5 m, 2.9 m
ceiling, window on the left wall. Add a kitchen island 2.8 m long, pendant
lights, oak floor. Give me an orbit camera and a button to save the current view
as an image.
```

03 Pick the camera

Choose the shot like a photographer: eye level, straight verticals, one strong composition. The 3D image is your skeleton, it fixes geometry and perspective.

04 Make it real on Higgsfield

Upload the 3D screenshot to Higgsfield (Nano Banana Pro) together with real material samples: stone, wood, fabric. Ask it to keep the exact geometry and camera, and replace the 3D surfaces with real ones.

```
Turn this 3D render into a photorealistic architectural photograph. Keep the
exact geometry, layout and camera. Use the attached samples for the materials.
Natural daylight, real textures, no added objects.
```

05 Refine

Fix one thing at a time: a material, the light, a detail. Small changes, same reference. Upscale only the final one.

06 Bring it to life

Optional: animate the final photo into a short clip on Higgsfield for the reveal.

Common mistakes

- Using mood photos as reference: the AI copies the whole picture, not the material. Use flat samples.
- Changing five things in one round: you lose what was working.
- Crooked camera in the 3D: tilted verticals never look like real photography.
- Asking the AI to invent the layout: geometry always comes from the 3D.
